

The background features abstract, overlapping green geometric shapes in various shades, creating a modern and dynamic look. The shapes are primarily triangles and polygons, some with thin white outlines, set against a light gray background.

# CS 35L

## Software Construction Laboratory

Lecture 7.2

21<sup>st</sup> February, 2019

# Logistics

- ▶ Hardware requirement for Week 8
  - ▶ Seeed Studio BeagleBone Green Wireless Development Board
- ▶ Presentations for Assignment 10
  - ▶ [https://docs.google.com/spreadsheets/d/1o6r6CKCaB2du3kIPfIHiquymhBvbn7oP0wkHHMz\\_q1E/edit?usp=sharing](https://docs.google.com/spreadsheets/d/1o6r6CKCaB2du3kIPfIHiquymhBvbn7oP0wkHHMz_q1E/edit?usp=sharing)
- ▶ Assignment 6 is due on 24<sup>th</sup> Feb, 2018 at 11:55pm

# Review - Previous Lab

- ▶ Handling Race Condition
- ▶ Mutex and Semaphores
- ▶ Pthread Library
  - ▶ Pthread create and join functions

# Dynamic Linking

# Lifecycle of a C program

- ▶ The following entities help in getting a C program to work
  - ▶ Compiler
  - ▶ Assembler
  - ▶ Linker
  - ▶ Loader

# Building an Executable File

Translates programming language statements into cpu's machine-language instructions

Takes one or more object files generated by a compiler and combines them into a single executable file

# Linking Libraries

A previously compiled  
collection of standard  
program functions

# Static Linking

- ▶ Carried out only once to produce an executable file
- ▶ If static libraries are called, the linker will copy all the modules referenced by the program to the executable
- ▶ Static libraries are typically denoted by the .a file extension

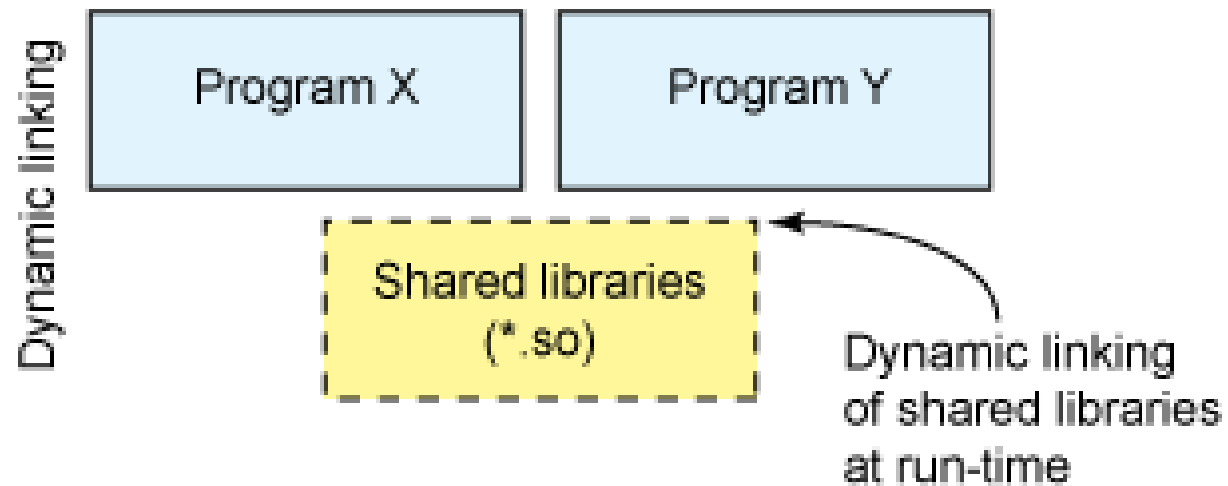

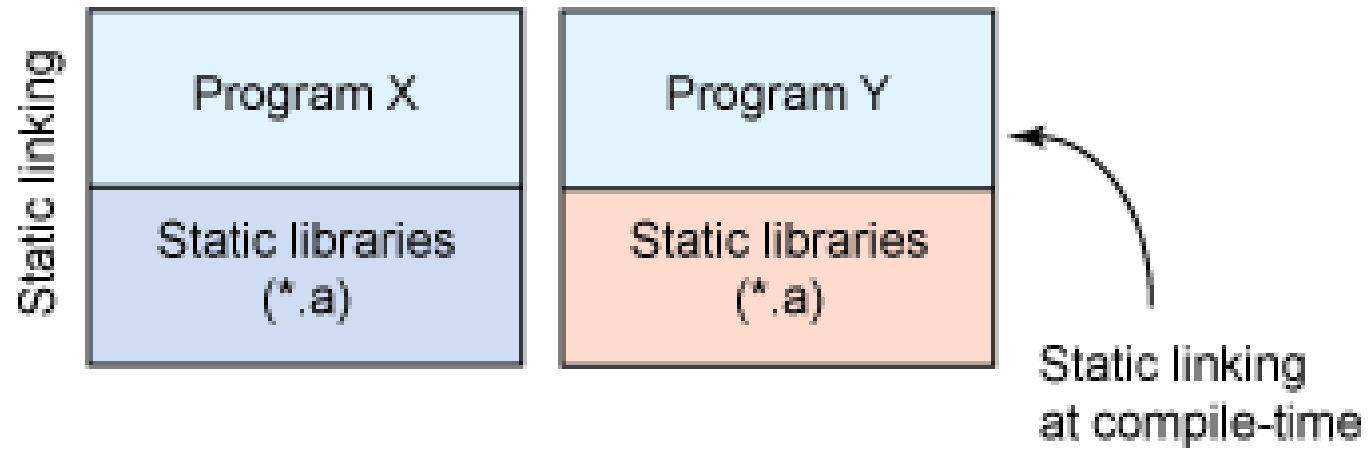

# Linking and Loading

- ▶ Linker collects procedures and links together the object modules into one executable program
- ▶ Why isn't everything written as just one big program, saving the necessity of linking?
- ▶ Efficiency: if just one function is changed in a 100K line program, why recompile the whole program? Just recompile the one function and relink.

# Dynamic Linking

- ▶ Allows a process to add, remove, replace or
- ▶ relocate object modules during its execution.
- ▶ If shared libraries are called:
  - ▶ Only copy a little reference information when the executable file is created
  - ▶ Complete the linking during loading time or running time
- ▶ Dynamic libraries are typically denoted by the .so file extension
  - ▶ .dll on Windows

# Dynamic Linking

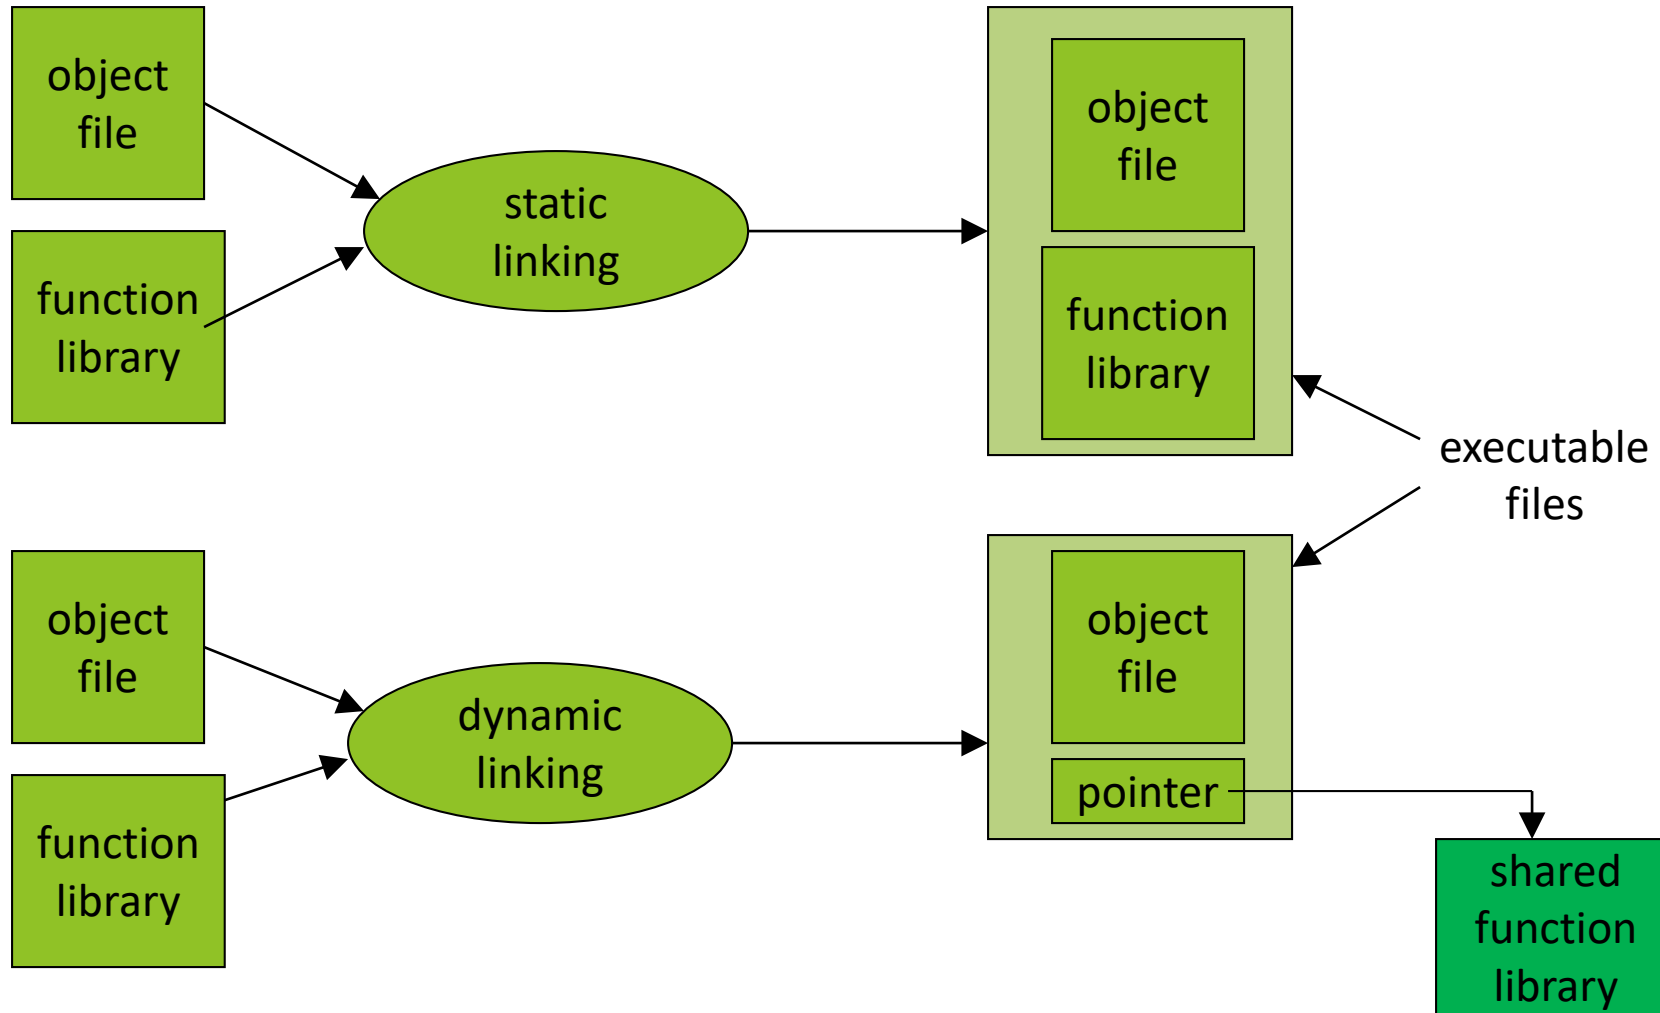

- ▶ Unix systems: Code is typically compiled as a dynamic shared object (DSO)
- ▶ Dynamic vs. static linking resulting size

```
$ gcc -static hello.c -o hello-static
$ gcc hello.c -o hello-dynamic
$ ls -l hello
  80 hello.c
13724 hello-dynamic
1688756 hello-static
```
- ▶ If you are the sysadmin, which do you prefer?

# Advantages of Dynamic Linking

- ▶ The executable is typically smaller
- ▶ When the library is changed, the code that references it does not usually need to be recompiled
- ▶ The executable accesses the .so at run time; therefore, multiple programs can access the same .so at the same time
- ▶ Memory footprint amortized across all programs using the same .so

# Smaller is more efficient

# Disadvantages of dynamic linking

- ▶ Performance hit
- ▶ Need to load shared objects (at least once)
- ▶ Need to resolve addresses (once or every time)
- ▶ Remember back to the system call assignment...
- ▶ What if the necessary dynamic library is missing?
- ▶ What if we have the library, but it is the wrong version?

# Assignment 7 - Laboratory

- ▶ Write and build simple `cos(sqrt(3.0))` program in C
  - ▶ Use `ldd` to investigate which dynamic libraries your `cos` program loads
  - ▶ Use `strace` to investigate which system calls your `cos` program makes
- ▶ Use `"ls /usr/bin | awk 'NR%101==nnnnnnnnnn%101'"` to find ~25 linux commands to use `ldd` on
  - ▶ Record output for each one in your log and investigate any errors you might see
  - ▶ From all dynamic libraries you find, create a sorted list
    - ▶ Remember to omit the duplicates!

# Assignment 6 - Homework

- ▶ Download the single-threaded ray tracer implementation
- ▶ Run it to get output image
- ▶ Multithread ray tracing
  - ▶ Modify main.c and Makefile
- ▶ Run the multithreaded version and compare resulting image with single-threaded one

# Assignment 6 - Homework

- ▶ Build a multi-threaded version of Ray tracer
- ▶ Modify "main.c" & "Makefile"
  - ▶ Include <pthread.h> in "main.c"
  - ▶ Use "pthread\_create" & "pthread\_join" in "main.c"
  - ▶ Link with -lpthread flag (LDLIBS target)
- ▶ make clean check
  - ▶ Outputs "1-test.ppm"
  - ▶ Can't see "1-test.ppm"
  - ▶ sudo apt-get install gimp (Ubuntu)
  - ▶ X forwarding (lnxsrvt)
    - ▶ ssh -X username@lnxsrvt.seas.ucla.edu
  - ▶ gimp 1-test.ppm

# Assignment 6 - Homework

- ▶ Ensure no compile error exists!
- ▶ Read the source code to understand the task
- ▶ **Don't modify other functions in the original code**
- ▶ How to divide the task to run multiple threads?
- ▶ Difficulty: the 3rd and 4th arguments of pthread\_create function
  - ▶ Argument 3: a function that divides the input by threads
  - ▶ Argument 4: an array to hold data for each thread

# 1-test.ppm

**Figure. 1-test.ppm  
& baseline.ppm**

# Presentations

- ▶ Today's Presentation:

- ▶ Yufei Wang
- ▶ Calvin Chen

- ▶ Next up:

- ▶ Renee Hsu
- ▶ Atharv
